Behind the Meter: Battery Energy Storage Concepts, Requirements, and Applications. By Sifat Amin and Mehrdad Boloorchi. Battery energy storage systems (BESS) are emerging in all areas of electricity sectors including generation services, ancillary services, transmission services, distribution services, and consumers' energy management services.

Large-scale battery storage facilities are increasingly being used as a solution to the problem of energy storage. The Internet of Things (IoT)-connected digitalized battery storage solutions are able to store and dynamically distribute energy as needed, either locally or from a centralized distribution hub.

Energy storage plays an important role in this balancing act and helps to create a more flexible and reliable grid system. For example, when there is more supply than demand, such as during the night when continuously operating power plants provide firm electricity or in the middle of the day when the sun is

Pumped thermal energy storage (PTES) is an advanced concept for thermo-mechanical energy storage and has the highest potential for development. While an ideal implementation can reach a storage efficiency of 100%, roundtrip efficiencies in the range between 50% and 70% are expected for technical systems.

The paper gives an overview of various high temperature thermal energy storage concepts such as thermocline [3], floating barrier [4] or embedded heat exchanger [7] that have been developed in recent years. In this context, a description of functionality, a summary of the technical specification and the state of development of each concept is given.
