Question 3: Capacitor energy storage What is the voltage  $V_i$  at which one (1) 3  $\mu\text{F}$  capacitor stores the same amount of energy as four (4) 3  $\mu\text{F}$  capacitors, each charged to  $V_2 = 20$  volts?  $V_i = 80$  (within three significant digits) This question is complete and cannot be answered again. Correct answer  $V_i = 40$  V Submitted answer 7 Incanto

From the definition of voltage as the energy per unit charge, one might expect that the energy stored on this ideal capacitor would be just  $QV$ . That is, all the work done on the charge in moving it from one plate to the other would appear as energy stored. But in fact, the expression above shows that just half of that work appears as energy stored in the capacitor.

In electrical engineering, a capacitor is a device that stores electrical energy by accumulating electric charges on two closely spaced surfaces that are insulated from each other. The capacitor was originally known as the condenser, [1] a term still encountered in a few compound names, such as the condenser microphone is a passive electronic component with two terminals.

We offer a vast array of capacitors to suit a wide variety of applications. Here is some information about capacitor types, how they work, how to choose them, and applications. A capacitor is a device that stores electrical energy in an electric field by accumulating electric charges on two surfaces insulated from each other but in close proximity.

The rechargeable C cell I mentioned above (1.2v, 2.2Ah) holds 9,500 joules. A capacitor holding this much energy at 1.2v would have to be  $(2 \times 9,500 / 1.2 \times 1.2) = 13,000 \text{ Farads}$ , so if it helps, you can think of a battery as an enormous capacitor.
