The minimum speed of the flywheel is typically half its full speed, the storage energy is given by  $\frac{1}{2} I f w f^2$  where  $I f$  is the rotor moment of inertia in  $\text{kgm}^2$  and  $w f$  maximum rotational speed in  $\text{rad/s}$ . The power level is controlled by the size of the M/G, so this is independent of the rotor.
