First, vanadium doesn't degrade. "If you put 100 grams of vanadium into your battery and you come back in

100 years, you should be able to recover 100 grams of that vanadium -- as long as the battery doesn't have some sort of a physical leak," says Brushett.

As a result, vanadium batteries currently have a higher upfront cost than lithium-ion batteries with the same capacity. Since they're big, heavy and expensive to buy, the use of vanadium batteries may be limited to industrial and grid applications.
