For the rechargeable energy storage, the following holds: $R(t+1) = \min\{R(t) + p(t), B\}$. The harvested energy that is discarded because the rechargeable energy storage is full is called "wasted energy" for short. The use of the backup battery in time interval $[t_1; t_2]$ is denoted as $E(t_1; t_2) = \int_{t_1}^{t_2} p(t) dt - \int_{t_1}^{t_2} R(t) dt$.

Energy storage technologies can be classified into five main energy storage categories: mechanical storage of power, heat energy storage, electrical processing, magnetic energy storage, and chemical energy storage [21]. These vary between physical and chemical as well as electromagnetic technology such as hydrogen energy storage.

3. Compressed Gas Storage Liquid Air Energy Storage. Liquid air energy storage (LAES) stores liquid air inside a tank which is then heated to its gaseous form, the gas is then used to rotate a turbine. Compressed gas systems have high reliability and a long-life span that can extend to over 30 years.
