The specific power consumption of the system is 7.46 kWh/kg, in which hydrate stirring occupies 47.84% of the hydrogen storage process energy consumption, having a significant impact on the energy consumption of the system. While the dehydrogenation process makes reasonable use of cold energy and saves power generation by 135.5 kW.

Hydrogen can be stored physically as either a gas or a liquid. Storage of hydrogen as a gas typically requires high-pressure tanks (350-700 bar [5,000-10,000 psi] tank pressure). Storage of hydrogen as a liquid requires cryogenic temperatures because the boiling point of hydrogen at one atmosphere pressure is -252.8°C.
