Such a converter must have bidirectional power flow capability with flexible control in all operating modes. In HEV applications, BDCs are required to link different dc voltage buses and transfer energy between them. For example, a BDC is used to exchange energy between main batteries (200-300V) and the drive motor with 500V dc link.

The bidirectional configuration-based converters act as interfacing element between energy storage devices and power sources which shrink the size of the converter and enhance the performance of the overall system because the requirement of two individual converters is not required to perform the forward and reverse directions of power flow.

The bidirectional DC-DC converters are widely used in the energy storage system (ESS) and DC distribution system. The power capacity is limited when the converter is operated with smooth power transfer. In addition, the directions of the inductor current and the capacitor voltage cannot change instantaneously.
