Capacitor energy storage is defined by the formula E = 1/2 CV², where E represents energy in joules, C signifies capacitance in farads, and V indicates voltage in volts. This equation encapsulates the relationship between these three fundamental electrical properties and serves as the cornerstone for analyzing energy stored in capacitors.

The energy stored on a capacitor can be expressed in terms of the work done by the battery. Voltage represents energy per unit charge, so the work to move a charge element dq from the negative plate to the positive plate is equal to V dq, where V is the voltage on the capacitor. The voltage V is proportional to the amount of charge which is already on the capacitor.
