Capacitance is defined as:  $C = Q/V$  Where  $Q$  is the charge stored on the capacitor's plates and  $V$  is the voltage across the capacitor. The work done to charge a capacitor (which is equivalent to the stored energy) can be calculated using the integral of the product of the charge and the infinitesimal change in voltage:

From the definition of voltage as the energy per unit charge, one might expect that the energy stored on this ideal capacitor would be just  $QV$ . That is, all the work done on the charge in moving it from one plate to the other would appear as energy stored. But in fact, the expression above shows that just half of that work appears as energy stored in the capacitor.
