This again demonstrates the crucial role of chemical-energy storage. It also illustrates that, in comparison with other storage, the energy density of chemical-energy storage is by far the highest. Power plant facilities have coal stockpiles with capacities ranging from several tens of thousands of tons to several hundreds of thousands of tons.

Among these, chemical energy storage (CES) is a more versatile energy storage method, and it covers electrochemical secondary batteries; flow batteries; and chemical, electrochemical, or thermochemical processes based on various fuels such as hydrogen, synthetic natural gas (SNG), methane, hydrocarbons, and other chemicals products.

An advantage of thermochemical energy storage, or TCES, over other methods is a higher energy density made possible by capturing heat in the form of chemical bonds, he said.
