The maximum capacity of the energy storage is  $E_{\max} = \frac{1}{2} L I_c^2$ , where  $L$  and  $I_c$  are the inductance and critical current of the superconductor coil respectively. It is obvious that the  $E_{\max}$  of the device depends merely upon the properties of the superconductor coil, i.e., the inductance and critical current of the coil. Besides  $E_{\max}$ , the capacity realized in a practical ...
