Liquid air energy storage (LAES) can be a solution to the volatility and intermittency of renewable energy sources due to its high energy density, flexibility of placement, and non-geographical constraints [6]. The LAES is the process of liquefying air with off-peak or renewable electricity, then storing the electricity in the form of liquid air, pumping the liquid.

Cold energy storage is another aspect of LNG cold energy utilization. As LNG regasification is a continuous process, the cold energy of LNG cannot be stored without transferring into an appropriate form of storage. Transferring LNG cold energy into the other forms of cold energy which are storable for a long period of time is desirable.
