A glimpse into the current capital cost estimates for ammonia energy storage shows that these revolve around 1350-1590\$/kW, while technologies such as lithium-ion and sodium-sulphur batteries are around 850-3660\$/kW, which places ammonia in a competing stance against battery storage solutions (European Commission (2021); IEA, 2017). Still ...

Ammonia (NH₃) plays an important role as a crop fertilizer and a starting reagent for the production of other chemicals [1], [2]. Significant recent advances in ammonia synthesis routes have further extended ammonia's applications to refrigeration, fermentation, and energy storage and conversion [3], as shown in Fig. 1 (A). With the global drive to reduce our ...

This new study, published in the January 2017 AIChE Journal by researchers from RWTH Aachen University and JARA-ENERGY, examines ammonia energy storage "for integrating intermittent renewables on the utility scale.".
