Add to this the serious issue of battery waste and the toxic process of recycling them and it is clear that now is the time for data centres to take another look at their power supply, sourcing more environmentally safe, longer-term solutions. In today's world, battery energy storage has a far broader - and more crucial - role to play.

In today's discussion, our panel of experienced data center executives - Jack Pouchet of Vertiv, Intel's Jeff Klaus, Erich Sanchack of Digital Realty and Dennis VanLith of Chatsworth Products - discuss the impact of power purchases by large data center operators on the accessibility of renewable power and energy storage.

Each data center is powered by multiple energy sources: power grid, off-site renewable energy and energy storage devices (ESDs), as depicted in Fig. 3. The system runs in a discrete-time slotted mode [15] with each time slot ranging from several minutes to hours, so it gives us plenty of time to make control decisions.
