Inside the system, electrically powered resistive heating elements heat air to more than 600°C. The hot air is circulated through a network of pipes inside a sand-filled heat storage vessel. The hot air then flows back out of the vessel into a heat exchanger, where it heats water that is then circulated through building heating systems.

Electricity storage is a key component in the transition to a (100%) CO<sub>2</sub>-neutral energy system and a way to maximize the efficiency of power grids. Carnot Batteries offer an important alternative to other electricity storage systems due to the possible use of low-cost storage materials in their thermal energy storage units.

When compared to sensible heat storage and latent heat storage, we can say that TCS system offers higher energy density as well as a wide range of operation temperatures with almost no heat leakage during the storage phase [23], [54]. However, lithium compounds are considered as a novel and promising materials for TCS system.

The heating elements are very efficient. Practically the entire solar electricity is converted to heat energy.
