The discharged energy-storage density (W_D) can also be directly detected by charge-discharge measurements using a specific circuit. The capacitor is first charged by external bias, and then, through a high-speed and high-voltage switch, the stored energy is discharged to a load resistor (R_L) in series with the capacitor. The current passed through the resistor $I(t)$ or ...

The classical flyback capacitor charger operates in CCM (continuous-conduction mode). Flat-topped, short-duration current pulses on the transformer's secondary charge the storage capacitors (Reference 3). Unfortunately, this charging strategy requires complex control circuitry to limit both the secondary current and the capacitor voltage.
