The need for electrical energy storage (EES) will increase significantly over the coming years. With the growing penetration of wind and solar, surplus energy could be captured to help reduce generation costs and increase energy supply. Read more IEC work for energy storage. You will find in this brochure a selection of articles from our ...

The ability to store energy after it is generated is critical to successful energy systems to ensure that it's available on demand. Energy sources that are not stored in mechanical energy systems take the form of alternating current (AC) electrical energy, which are later converted into direct current (DC) electrical energy for storage.

Energy storage with hydrogen, which is still emerging, would involve its conversion from electricity via electrolysis for storage in tanks. From there it can later undergo either re-electrification or supply to emerging applications such as transport, industry or residential as a supplement or replacement to gas. Choosing the best energy ...
