Co-located energy storage systems can be either DC or AC coupled. AC coupled configurations are typically used when adding battery storage to existing solar photovoltaic (PV) systems, as they are easier to retrofit. AC coupled systems require an additional inverter to convert the solar electricity from AC back to DC in order to charge batteries.

In this article we'll cover the basics of thermal energy storage systems. Thermal energy storage can be accomplished by changing the temperature or phase of a medium to store energy. This allows the generation of energy at a time different from its use to optimize the varying cost of energy based on the time of use rates, demand charges and ...

Demand for energy storage is on the rise. The increase in extreme weather and power outages also continue to contribute to growing demand for battery energy storage systems (BESS). As a result, there are many questions about sizing and optimizing BESS to provide either energy, grid ancillary services, and/or site backup and blackstart capability.

The energy storage system of most interest to solar PV producers is the battery energy storage system, or BESS. While only 2-3% of energy storage systems in the U.S. are BESS (most are still hydro pumps), there is an increasing move to integrate BESS with renewables. What is a BESS and what are its key characteristics?

Simply put, utility-scale battery storage systems work by storing energy in rechargeable batteries and releasing it into the grid at a later time to deliver electricity or other grid services. Without energy storage, electricity must be produced and consumed at exactly the same time.
