

Phase change materials have gained attention in battery thermal management due to their high thermal energy storage capacity and ability to maintain near-constant temperatures during phase change. By absorbing or releasing latent heat, PCMs offer a promising solution for managing heat in lithium-ion batteries.

Heat storage in separate TES modules usually requires active components (fans or pumps) and control systems to transport stored energy to the occupant space. Heat storage tanks, various types of heat exchanges, solar collectors, air ducts, and indoor heating bodies can be considered elements of an active system.
