

Abstract A unique substance or material that releases or absorbs enough energy during a phase shift is known as a phase change material (PCM). Usually, one of the first two fundamental states of matter--solid or liquid--will change into the other. Phase change materials for thermal energy storage (TES) have excellent capability for providing thermal ...

Because the purpose of the chemical process is energy storage, a critical component of the subsystem is the storage tanks. Thermochemical storage mechanisms have a higher energy density than thermal methods, which could help lower capital costs by reducing storage tank volumes ().When energy is required from storage, the TCES subsystem delivers heat to the ...
