Cryogenic energy storage (CES) is the use of low temperature liquids such as liquid air or liquid nitrogen to store energy. [1] [2] The technology is primarily used for the large-scale storage of electricity. Following grid-scale demonstrator plants, a 250 MWh commercial plant is now under construction in the UK, and a 400 MWh store is planned in the USA.

In the traditional TENG, the output is alternating current in the direction of change, but in order to achieve reasonable energy storage and energy use, it is likely to add rectifier current to convert AC into DC, and then convert it into the required electrical energy through buck-boost and voltage stabilization circuits.
