1 Introduction. Lithium-ion batteries are widely used in the power systems of new energy vehicles (EVs). Due to the low cell voltage and capacity, battery cells must be connected in series and parallel to form a battery pack in order to meet application requirements (Tang et al., 2020; Cao and Abu Qahouq, 2021; Xia and Abu Qahouq, 2021; Wang et al., 2022).

An LC circuit is used to store electrical energy in the circuit with the help of magnetic resonance. The energy or current in an LC circuit oscillates between the inductor and capacitor just like a pendulum swings back and forth. An LC circuit is used to store electrical energy in the circuit with the help of magnetic resonance.

In the past few decades, electricity production depended on fossil fuels due to their reliability and efficiency [1]. Fossil fuels have many effects on the environment and directly affect the economy as their prices increase continuously due to their consumption which is assumed to double in 2050 and three times by 2100 [6] g. 1 shows the current global ...

At most times, some energy is stored in the capacitor and some energy is stored in the inductor. We can put both terms on each side of the equation. By examining the circuit only when there is no charge on the capacitor or no current in the inductor, we simplify the energy equation.
