

Saturn Saturn and its spectacular rings, in a natural-color composite of 126 images taken by the Cassini spacecraft on October 6, 2004. The view is directed toward Saturn's southern hemisphere, which is tipped toward the Sun. Shadows cast by the rings are visible against the bluish northern hemisphere, while the planet's shadow is projected on the rings to ...

How to Use the Planet Chart. Using the four buttons at the top, select either Distance from the Sun, Distance from the Earth, Size in the Sky, or Brightness to control how the planets are displayed.; Press the Play button at the bottom of the chart to make time move in fast forward mode. You can also move backward and forwards in time by sliding the hand cursor along the ...

On average Saturn is 886 million miles (1.4 billion kilometers) from the Sun. This is 9.5 astronomical units (AU) with one unit equating to the average distance between the Sun and Earth. Essentially then Saturn is 9.5 times ...

We already know that the distance of all the planets are generally calculated by keeping the Sun as the main location point. The distances of all the planets from the Sun in scientific notation and exponential form-Mercury- 57 million kilometers. Scientific notation- 5.7\* 10^7 & quot;km" Venus- 108 million kilometers. Scientific notation- 1.08 \* 10^8 & quot;km" Earth- 150 ...

Our Sun is a medium-sized star with a radius of about 435,000 miles (700,000 kilometers). Many stars are much larger - but the Sun is far more massive than our home planet: it would take more than 330,000 Earths to match the mass of the Sun, and it would take 1.3 million Earths to fill the Sun"s volume. The Sun is about 93 million miles (150 ...

How far away is Saturn? Saturn is the sixth planet from the Sun. Billions of kilometers separate it from the Sun and the Earth. How far is Saturn from the Sun? The ringed planet orbits the Sun at a distance of about 9.5 AU ...

Introduction. The planetary system we call home is located in an outer spiral arm of the Milky Way galaxy. Our solar system consists of our star, the Sun, and everything bound to it by gravity - the planets Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, and Neptune; dwarf planets such as Pluto; dozens of moons; and millions of asteroids, comets, and meteoroids.

But just how far away is Mars from Earth, the Sun, and the other planets in our solar system? ... As the second-closest planet to the Sun, Venus stands apart from Mars by 74.4 million miles. This comes to 0.8 AUs. ... Distance From Saturn to Mars: 743.6 Million Miles. The distance from Mars to Saturn is approximately 743.6 million miles.

## How many planets away is saturn from the sun

Saturn, best known for its rings made of billions of ice particles, is 886.7 million miles away from the sun and 550.9 million miles from Earth. It has a diameter of 74,600 miles, making it the second largest planet in the solar system. It takes 29.456 Earth years for Saturn to revolve around the sun and 10.2 Earth hours to rotate on its axis.

Saturn is the sixth planet from the Sun and the second largest in the Solar System, after Jupiter. It is a gas giant, with an average radius of about nine times that of Earth. [27] [28] It has an ...

At perihelion, the closest point to the Sun, Saturn is about 9.05 AU away, which is approximately 1.35 billion kilometers or 839 million miles. At aphelion, the farthest point, Saturn is about 10.12 AU from the Sun, approximately 1.52 billion kilometers or 941 million miles. ... Saturn, the sixth planet from the Sun, is an intriguing subject of ...

According to one well-supported theory, the shifting orbits of the four giant planets (Jupiter, Saturn, Uranus, and Neptune) could have caused most of the original material - likely 7 to 10 times the mass of Earth - to be lost. ... they are closer to the Sun and sometimes they are farther away). ... Many comets crash into the Sun or the ...

Saturn. Uranus. Neptune. Pluto & Dwarf Planets. Asteroids, Comets & Meteors. The Kuiper Belt ... From an average distance of 142 million miles (228 million kilometers), Mars is 1.5 astronomical units away from the Sun. One astronomical unit (abbreviated as AU), is the distance from the Sun to Earth. ... The Red Planet is actually many colors ...

Saturn is the sixth planet from the Sun and the second largest in the Solar System, after Jupiter is a gas giant, with an average radius of about nine times that of Earth. [27] [28] It has an eighth the average density of Earth, but is over 95 times more massive.[29] [30] [31] Even though Saturn is almost as big as Jupiter, Saturn has less than a third the mass of Jupiter.

For instance, Mercury is the closest planet to the sun. On average, it is about 36 million miles away. In light years, that number would be 0.000006123880620837039 light years away. It's much easier to say that it is about 3.3 light minutes away, meaning it would take about 3.3 minutes for light to travel between Mercury and the sun.

With an equatorial diameter of about 74,897 miles (120,500 kilometers), Saturn is 9 times wider than Earth. If Earth were the size of a nickel, Saturn would be about as big as a volleyball. From an average distance of 886 million miles (1.4 billion kilometers), Saturn is 9.5 astronomical units away from the Sun.

Our solar system is made up of a star--the Sun--eight planets, 146 moons, a bunch of comets, asteroids and space rocks, ice, and several dwarf planets, such as Pluto. The eight planets are Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, and Neptune. Mercury is closest to the Sun. Neptune is the farthest.

## How many planets away is saturn from the sun

The order of the planets in the solar system, starting nearest the sun and working outward is the following: Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, Neptune and then the possible ...

How Far Away is Saturn From the Sun? Saturn's orbit around the Sun averages out at 886 million miles (1.43 billion km). But, because Saturn's orbit is elliptical, just like all the other planets, there are times when the gas giant is closer to the Sun and farther away from it. ... As the planets orbit the Sun, this time varies between 1 ...

Six of the planets and many smaller bodies also ... rotated by about 30° due primarily to the synodic period of Jupiter and Saturn. [151] The Sun"s gravitational field is estimated to ... Mission data allowed scientists to identify several different types of flares and demonstrated that the corona away from regions of peak activity was much ...

From an average distance of 886 million miles (1.4 billion kilometers), Saturn is 9.5 astronomical units away from the Sun. One astronomical unit (abbreviated as AU), is the distance from the ...

Venus is the second planet from the sun and the closest planet to Earth. Venus orbits the sun at an average distance of 0.722 AU, equating to 67-million miles on average. The orbit of Venus causes it to drift between 66 to 68-million miles from the sun. Earth is the third planet from the sun at an average distance of one AU. Scientists base ...

Saturn is the farthest away of the naked-eye planets, which humans have been studying since long before the invention of the telescope. It can be seen, at some point or another, on most nights. At opposition, when it lies directly opposite the Sun, Saturn is visible all night.

The giant planets (Jupiter, Saturn, Uranus, and Neptune) ... This gives the planet extreme seasonal variation as each pole points toward and then away from the Sun. [184] ... [196] [201] Many dwarf planet candidates are being considered, pending further data for ...

Distances between the planets, and especially between the stars, can become so big when expressed in miles and kilometers that they"re unwieldy. ... When measured in astronomical units, the 886,000,000-mile (1,400,000,000-kilometer) distance from the Sun to Saturn"s orbit, is a much more manageable 9.5 AU. ... the nearest star system to ours is ...

"A year is defined as the time it takes a planet to complete one revolution of the Sun, for Earth this is just over 365 days. This is also known as the orbital period. Unsurprisingly the the length of each planet"s year correlates with its distance from the Sun as seen in ...
