Indeed, the development of high strength, low-density carbon fiber composites (CFCs) in the 1970s generated renewed interest in flywheel energy storage. Based on design strengths typically used in commercial flywheels, σ_{max} / ρ is around 600 kNm/kg for CFC, whereas for wrought flywheel steels, it is around 75 kNm/kg.

Flywheel Energy Storage systems are impressive in almost all metrics. They can be deployed anywhere, are extremely efficient and responsive and, best of all, have a very low carbon footprint, particularly considering that any units constructed may last indefinitely.

Think of it as a mechanical storage tool that converts electrical energy into mechanical energy for storage. This energy is stored in the form of rotational kinetic energy. Typically, the energy input to a Flywheel Energy Storage System (FESS) comes from an electrical source like the grid or any other electrical source.

About Flywheel Technology. Flywheel energy storage technology is a mechanical energy storage form. It works by accelerating the rotor (flywheel) at a very high speed.
