Connect the positive terminal of the first battery to the negative terminal of the second battery. Ensure both batteries are of the same type and capacity. The remaining terminals can connect to your inverter or solar charge controller. Series connections are beneficial when your solar system needs higher voltage to efficiently power appliances.

12V is the most common solar panel wiring connection with batteries, as most appliances are designed to operate on 12V. With a 12V system, parallel orientation is usually preferred for both panels and batteries. This is because increasing the amps allows for devices to be powered for much longer than they could be when wired in series.

How to Wire Solar Panels in Series. To wire solar panels in series, you'll connect the positive terminal on one panel to the negative terminal on the second panel. If you're wiring multiple panels, you'll simply continue this pattern of connecting all of the panels, from the positive of one panel to the negative of the next, and so on.

Wiring solar panels in series requires connecting the positive terminal of a module to the negative of the next one, increasing the voltage. To do this, follow the next steps: Connect the female MC4 plug (negative) to the male MC4 plug (positive). Repeat steps 1 and 2 for the rest of the string.

It allows for charging the auxiliary battery while isolating it from the primary battery when not charging. 4.
