By doing this, the hydraulics are used as an auxiliary energy storage device. This means that hydraulic fluids are stored in the accumulators, and when the pressure from the system is released, the angle of the blade can change. By changing the angle of the blade, hydraulics optimize the amount of energy accumulated in different wind conditions.

Energy may be stored by injecting fluid into a fracture in the earth and producing the fluid back while recovering power and/or desalinating water. The method may be particularly adapted to storage of large amounts of energy such as in grid-scale electric energy systems. The fracture may be formed and treated with resin so as to limit fluid loss and to increase ...
