A hydraulic system is a set of interconnected components designed to transmit power through the use of an incompressible fluid, such as hydraulic oil. These systems work following Pascal's principle, which states that a change in pressure applied at one point in an incompressible fluid is transmitted without loss to all points in the fluid and ...

Pumped storage hydropower (PSH) is a type of hydroelectric energy storage. It is a configuration of two water reservoirs at different elevations that can generate power as water moves down from one to the other (discharge), passing through a turbine. The system also requires power as it pumps water back into the upper reservoir (recharge).
