Energy storage involves converting energy from forms that are difficult to store to more conveniently or economically storable forms. Some technologies provide short-term energy storage, while others can endure for much longer. Bulk energy storage is currently dominated by hydroelectric dams, both conventional as well as pumped.

Energy storage is primarily used to test a range of other functions to assess its capabilities. An energy storage system is charged from the grid or by on-site generation to be used at a later time to take advantage of price differentials. Energy storage is used instead of upgrading the transmission network infrastructure.

This technology would make energy storage more accessible, affordable, and scalable, opening up new possibilities for renewable energy. In the UK, a trailblazer project, Gravitricity, has been testing a gravity battery in Edinburgh by using a 15-meter steel tower to bring the heavy weight up and down using solar power.
