The rechargeable C cell I mentioned above (1.2v, 2.2Ah) holds 9,500 joules. A capacitor holding this much energy at 1.2v would have to be  $(2 \times 9,500 / 1.2 \times 1.2) = 13,000$  Farads, so if it helps, you can think of a battery as an enormous capacitor. The energy-storage performance of a capacitor is determined by its polarization-electric field (P-E) loop; the recoverable energy density  $U_e$  and efficiency  $i$  can be calculated as follows:  $U_e = \frac{1}{2} P_m E_d$ ,  $i = \frac{U_e}{U_e + U_{loss}}$ , where  $P_m$ ,  $P_r$ , and  $U_{loss}$  are maximum polarization, remnant polarization, and energy loss, respectively ...
