While a steam tank holds 2.4-ish GJ, each heat pipe unit stores 0.5 GJ and a reactor 5GJ. So there's actually a massive energy buffer even with no tanks. Personally I just use a steam tank to gauge how much steam is inside the pipes, sending the result to the circuit network and eventually inserting fuel only when steam is lower than like 20k.

"The investment cost share of the storage tanks increases only by 3% from a daily to a weekly storage cycle, which corresponds to an increase in the levelized cost of merely 0.01 \$/kWh."
