Both have been shown to enhance power output and efficiency greatly [186 - 188]. Additionally, part of cold energy from liquid nitrogen can be recovered and reused to separate and condense carbon dioxide at the turbine exhaust, realizing carbon capture without additional energy input.

LH2 is generally stored in the highly insulated cryogenic tanks at 20 K, but the large temperature difference with the ambient temperature leads to irreversible heat leakage through the tanks [13]. Due to the small latent heat of the LH2, the heat leakage allows the LH2 to partially evaporated, producing boil-off gas (BOG) and causing a complex series of thermal ...
