Ion Power Cells are electronic items crafted using the Fabricator. They function identically to normal Power Cells but hold five times as much power, at the cost of taking five times longer to be fully charged due to the increased capacity. A single Ion Power Cell has a maximum energy capacity of 1000. It is unlocked by collecting the data from the Orange Data Terminal inside ...

The high energy density in lithium batteries makes them more susceptible to these reactions. Depending on the battery chemistry, size, design, component types, and amount of energy stored in the lithium cell, lithium cell failures can result in chemical and/or combustion reactions, which can also result in heat releases and/or over-pressurization.
