Low Energy Density: Compared to other forms of energy storage like batteries, capacitors store less energy per unit of volume or mass, making them less suitable for long-duration energy storage. **High Self-Discharge:** Capacitors tend to lose their stored energy relatively quickly when not in use, known as self-discharge.

Capacitors used for energy storage. Capacitors are devices which store electrical energy in the form of electrical charge accumulated on their plates. When a capacitor is connected to a power source, it accumulates energy which can be released when the capacitor is disconnected from the charging source, and in this respect they are similar to batteries.
