Peak shaving and load shifting. When the power on the grid meter shows more than the peak power or below the off-peak power which we set, the storage system will discharge or charge to hold the meter power below (Peak-Delta) or higher than (Off-Peak-Delta). When peak shaving and load shifting are not triggered, the system output input is 0kW.

By serving as both generation and load, energy storage can provide benefits to both consumers and the grid as a whole. For most commercial customers, the primary energy storage applications are: Energy Arbitrage (buy low, sell/use high) Demand Charge Management Power Factor Charge Management Momentary Outages Sustained Outages

Energy storage can facilitate both peak shaving and load shifting. For example, a battery energy storage system (BESS) can store energy generated throughout off-peak times and then discharge it during peak times, aiding in both peak shaving (by supplying stored energy at peak periods) and load shifting (by charging at off-peak periods). Below shows examples of a BESS being used ...

Besides, CAES is appropriate for larger scale of energy storage applications than FES. The CAES and PHES are suitable for centered energy storage due to their high energy storage capacity. The battery and hydrogen energy storage systems are perfect for distributed energy storage.

DSP. During the peak-times, the equipment injects active power on the grid from the battery banks. During the off-peak-times, the equipment charges its batteries from the grid, with lower cost energy.

What Is Peak Shaving? Also referred to as load shedding, peak shaving is a strategy for avoiding peak demand charges on the electrical grid by quickly reducing power consumption during intervals of high demand. Peak shaving can be accomplished by either switching off equipment or by utilizing energy storage such as on-site battery storage systems.
