The composite material flywheel rotor of a flywheel energy storage system (FESS) has a low natural frequency. When the system suffers from noise interference, the magnetic bearing generates a force with the same frequency as the natural frequency and causes vibration to occur. Thus, it is necessary to suppress the natural vibration of the magnetic suspended (MS) FESS.

Flywheels are an ingenious way to store energy. Essentially, a giant rotor is levitated and spun in a chamber by way of magnets. Since there is very little friction, the flywheel spins continually with very little added energy input needed. Energy can then be drawn from the system on command by tapping into the spinning rotor as a generator.
