BESS are one of the main energy storage system: sometimes they are also called electrochemical energy systems to distinguish them from others, such as gravitational energy systems (including pumped-storage hydroelectric power plants), mechanical energy systems (including compressed air or flywheel systems) and (Thermal Energy Storage, TES) systems

Considering the aspects discussed in Sect. 2.2.1, it becomes clear that the maximum energy content of a flywheel energy storage device is defined by the permissible rotor speed. This speed in turn is limited by design factors and material properties. If conventional roller bearings are used, these often limit the speed, as do the heat losses of the electrical machine, ...

Flywheel energy storage is a promising technology for replacing conventional lead acid batteries as energy storage systems. Most modern high-speed flywheel energy storage systems (FESS) consist of a huge rotating cylinder supported on a stator (the stationary part of a rotary system) by magnetically levitated bearings.

Development directions in mobile energy storage technologies are envisioned. Carbon neutrality calls for renewable energies, and the efficient use of renewable energies requires energy storage mediums that enable the storage of excess energy and reuse after spatiotemporal reallocation.
