For example, Salameh et al. [113] collects thermal energy through the use of trough solar panels and runs the process of refrigeration and cold storage by replacing the electric compressor with a thermally driven device, storing the cold energy in a 2.6 m 3 cold storage tank to meet the daily cold load demand of the July.

Co-locating energy storage with a wind power plant allows the uncertain, time-varying electric power output from wind turbines to be smoothed out, enabling reliable, dispatchable energy for local loads to the local microgrid or the larger grid.

In addition to BIPV, photovoltaics in buildings is also associated with building attached photovoltaic (BAPV) systems [2]. While both represent active surfaces, BIPV refers to the integration of photovoltaics to buildings as ancillary substitute to envelopes, whereas BAPV refers to a traditional approach of fitting PV modules to existing surfaces without dual functionality [[2], ...
