While batteries and capacitors are both energy storage devices, they differ in some key aspects. A capacitor utilizes an electric field to store its potential energy, while a battery stores its energy in chemical form. Battery technology offers higher energy densities, allowing them to store more energy per unit weight than capacitors.

The rise in prominence of renewable energy resources and storage devices are owing to the expeditious consumption of fossil fuels and their deleterious impacts on the environment [1]. A change from community of "energy gatherers" those who collect fossil fuels for energy to one of "energy farmers", who utilize the energy vectors like biofuels, electricity, ...

Due to the oxidation treatment, the device's energy storage capacity was doubled to  $430 \text{ mFcm}^{-3}$  with a maximum energy density of  $0.04 \text{ mWh cm}^{-3}$ . In addition, FSCs on CNT-based load read a higher volumetric amplitude of the lowest  $1140 \text{ mFcm}^{-3}$  with an estimated loss of  $\approx 2\%$  [ 63 ].
