The large-scale grid-connection of wind power has brought new challenges to safe and stable operation of the power system, mainly due to the fluctuation and randomness wind power output (Yuan et al., 2018, Yang Li et al., 2019). To mitigate the impact of new energy sources on the grid, it is effective to incorporate a proportion of energy storage within wind farms.

The aim of energy storage assets is to store energy at times when it can be produced in ample supply for later consumption when demand is higher, or generation levels are lower. How the use of electricity is deferred is key to understanding the economic, technical and political considerations associated with energy storage.

The report advocates for federal requirements for demonstration projects that share information with other U.S. entities. The report says many existing power plants that are being shut down can be converted to useful energy storage facilities by replacing their fossil fuel boilers with thermal storage and new steam generators.

Energy storage is a potential substitute for, or complement to, almost every aspect of a power system, including generation, transmission, and demand flexibility. Storage should be co-optimized with clean generation, transmission systems, and strategies to reward consumers for making their electricity use more flexible.
