Hydrogen has the highest energy content per unit mass (120 MJ/kg H<sub>2</sub>), but its volumetric energy density is quite low owing to its extremely low density at ordinary temperature and pressure conditions. At standard atmospheric pressure and 25 °C, under ideal gas conditions, the density of hydrogen is only 0.0824 kg/m<sup>3</sup> where the air density under the same conditions ...

Hydrogen can be stored physically as either a gas or a liquid. Storage of hydrogen as a gas typically requires high-pressure tanks (350-700 bar [5,000-10,000 psi] tank pressure). Storage of hydrogen as a liquid requires

cryogenic temperatures because the boiling point of hydrogen at one atmosphere pressure is  $-252.8^{\circ}\text{C}$ .
