

There is an urgent global need for electrochemical energy storage that includes materials that can provide simultaneous high power and high energy density. One strategy to achieve this goal is with pseudocapacitive materials that take advantage of reversible surface or near-surface Faradaic reactions to store charge.

Supercapacitors can improve battery performance in terms of power density and enhance the capacitor performance with respect to its energy density [22,23,24,25]. They have triggered a growing interest due to their high cyclic stability, high-power density, fast charging, good rate capability, etc. [1]. Their applications include load-leveling systems for string ...
