Since 2005, when the Kyoto protocol entered into force [1], there has been a great deal of activity in the field of renewables and energy use reduction. One of the most important areas is the use of energy in buildings since space heating and cooling account for 30-45% of the total final energy consumption with different percentages from country to country [2] and 40% in the European ...

Thermal energy storage (TES) is a technology that stocks thermal energy by heating or cooling a storage medium so that the stored energy can be used at a later time for heating and cooling applications and power generation. TES systems are used particularly in buildings and in industrial processes. This paper is focused on TES technologies that provide a way of ...

Thermal energy storage could connect cheap but intermittent renewable electricity with heat-hungry industrial processes. These systems can transform electricity into heat and then, like typical batteries, store the energy and dispatch it as needed. Rondo Energy is one of the companies working to produce and deploy thermal batteries.

(B) Monthly duration of average wind and solar energy in the U.K. from 2018 to 2020.

Motivation. Large-scale thermal energy storages offer more flexibility in DH Systems (also adding operational flexibility to power plants and industrial processes), they enable a higher share of renewables and waste heat, they can provide peak shaving functionality for electricity grids through Power-to-Heat (P2H) thus enabling sector coupling of the power and heating sector.

Mobilized thermal energy storage (M-TES) is a promising technology to transport heat without the limitation of pipelines, therefore suitable for collecting distributed renewable or recovered resources. In particular, the M-TES can be flexibly used for the emergency heating in the COVID-19 era. Though the M-TES has been commercializing in ...
