Although the industrial sector has traditionally been involved in managing power use with what today would be considered smart grid technologies, these applications have mostly been one-of-a-kind, requiring substantial customization. Our objective in this article is to motivate greater interest in smart grid applications in industry.

Smart Grid is the name of the communication between the utility and the consumer. A smart grid is a powerfully manufactured plant that consists of computer programming, digitalization, automation, and control

analyst that performs a two-way communication between the power provider and the consumer.

For the smart grid, we're still in the early stages of developing the framework for the standards and the lists of specific standards. Go to the Examples of Smart Grid Standards page for descriptions--both non-technical and technical--of some already-established, individual standards that are expected to enable the growth of the smart grid.

The state of the power system has changed over the last decades. Recently, the power system has faced several challenges and issues. On the one side, demands for electrical energy are increasing day-by-day, with power losses, grid failure, and lack of smart technology; on the other side, security threats are also increasing. The current power grid cannot deal with ...
