Solar cooling technologies are an emerging field that aims to directly harness solar energy for air conditioning and refrigeration solutions. Solar absorption chillers use solar heat to drive a chemical process that cools the air. These systems require a solar thermal collector to provide the heat energy necessary for the chiller's operation.

Energy storage at small-to-medium scale can be done via chemical battery storage for electrical cooling technologies or via hot water for thermal cooling technologies. Large-scale solar systems can make use of sensible solid storage, such as concrete (with a heat transfer fluid) or liquid storage (e.g., molten salts).
