

Tesla powerwall

We had our Powerwall installed in our garage about a month ago. It's right beside our bathroom and we've noticed a low frequency thump, thump thump in the bathroom. I couldn't hear anything when going near the Powerwall initially, but tonight I put my ear up against it and you can hear the same sound which is obviously being amplified up the wall.

I'm confused. Anyone know what the current regulations are? this comes from NFPA 855, which was updated to require "if the room is unfinished, the walls and ceiling need to be protected by at least 5/8 in. (16 mm) gypsum board." which was updated in 2021, and many municipalities adopting it in 2022.

My installation of two Powerwall 3 units with solar has been completed yesterday. Commissioning done, but no PTO yet. There are two PW3 units and Tesla Backup Gateway for whole home backup. It is one site. However, the Tesla app shows two individual sites, one per each PW3. It seems like they are completely independent sites, like two different ...

Most UPS's work if you have Tesla reduce the max frequency when full and off-grid to 62.5hz. Most grid-tied solar inverters shut off before 62.5hz. I do not understand why Tesla doesn't make a software change to raise it to 62.5 and only raise it higher if the solar inverters are still producing power after 60 seconds. 1.

Tesla Powerwall - Legal Challenge. My experience with the Tesla Powerwall is likely similar to many others. When it was initially installed in early 2019, it was connected to the internet. However, as the house changed ownership, the Wi-Fi password was updated, and the new owner was unaware of the need to reconnect the Powerwall to the internet.

StarFire82. o 6 mo. ago. Powerwall 3 seems intended for cases where people have larger solar systems with less batteries, since the power output is higher but the capacity isn't. For those buying more batteries for the capacity the extra capability if having multiple powerwall 3s is wasted and likely an unnecessary cost.

Tesla One app doesn't have any errors in it, and system seems to be working fine. Update: I looked at each Powerwall and notice that one out of the three aren't updated to the latest version, so it appears it's stuck or the update failed. Manually updating via the Tesla One app doesn't do anything, so opening a ticket with support.

Thoughts on Powerwall and if it's worth it. PowerWall. Ever since Tesla started to require a Powerwall with their solar panels I've been hesitant to add Tesla solar to my home. I've been trying to find all the benefits that would make an extra 10.5k (Before incentives) worth it. The only benefit I can see is that I can have power during a power ...

Generally a minimum string of 2 with modern modules should be required. You should not mix different roof planes on a single mppt. If all of your solar panels are on the same roof plane then shading is the next concern.

Tesla powerwall

If one panel is shaded in a string all the panels in that string are reduced to the same output of the shaded panel.

If all you are wanting to do is load-shift usage to cheaper rates, no, a Powerwall probably isn't actually worth it. I calculated that in my area, I would save about a dollar a day if I had my Powerwall shift 100% of its capacity from peak to off-peak.
