The world lacks safe, low-carbon, and cheap large-scale energy alternatives to fossil fuels. Until we scale up those alternatives the world will continue to face the two energy problems of today. The energy problem that receives most attention is the link between energy access and greenhouse gas emissions.

A model from the National Renewable Energy Laboratory (NREL) looked at the impact of energy storage on wind power and found in a "status quo" case, building approximately 30 GW of energy storage could permit the installation of an even higher 50 GW wind generation capacity by 2050, a 17-percent boost compared to a situation with no energy ...

The Department of Energy recently announced funding for a pilot concentrated solar power plant based on this concept. Batteries are useful for short-term energy storage, and concentrated solar power plants could help stabilize the electric grid. However, utilities also need to store a lot of energy for indefinite amounts of time.

New energy storage devices such as batteries and supercapacitors are widely used in various fields because of their irreplaceable excellent characteristics. Because there are relatively few monitoring parameters and
