Compressed air energy storage (CAES) plants are largely equivalent to pumped-hydro power plants in terms of their applications. But, instead of pumping water from a lower to an upper pond during periods of excess power, in a CAES plant, ambient air or another gas is compressed and stored under pressure in an underground cavern or container.

The principle of compressed gas energy storage involves several key elements: 1. Energy conversion, 2. Compression process, 3. Storage mechanism, 4. Energy release. This technology entails converting excess electrical energy into potential energy through compression, which can later be utilized when demand peaks.
