The solar thermal system had a gross collector area of 1500 m² that was directly connected to a 200 m³ pressurized solar energy storage tank for steam storage. The mashing process was initiated at 58 °C and finished at around 78 °C. Heat is removed from the storage system when the temperature is sufficient for mashing.

Particle thermal energy storage is a less energy dense form of storage, but is very inexpensive (\$2-\$4 per kWh of thermal energy at a 900°C charge-to-discharge temperature difference). The energy storage system is safe because inert silica sand is used as storage media, making it an ideal candidate for massive, long-duration energy storage.
