Fthenakis, Zweibel and Mason (2010) published a study on the feasibility of very-large-scale photovoltaic systems in the southwestern US, and dispersed generation throughout the country. A renewable-energy electricity ...

Some of these methods could increase the PCE past the Shockley-Queisser (SQ) limit of ~33%, making them viable "third generation photovoltaic" (TGPV) cell architectures. Surpassing the SQ limit for single junction solar cells presents both a scientific and a technological challenge, and the use of semiconductor NCs to enhance the ...

i Methodology Guidelines on Life Cycle Assessment of Photovoltaic Electricity: 3rd Edition IEA-PVPS-TASK 12 1 Executive Summary 2 Life Cycle Assessment (LCA) is a structured, comprehensive method of quantifying material and energy flows and their associated emissions caused in the life cycle of goods and services. The ISO 14040 and 14044 standards provide ...

2. Overview of photovoltaic technologies. Over the last twenty years, the PV industry showed annual growth rates between 40 % and 80 %, proving its strength and potential to become a major worldwide power generation source (Joint Research Centre [JRC], 2010). The enormous potential of PV is also evident by the fact that the existing global energy demands ...

In general they are referred to as Third or Next Generation photovoltaics (PV) (Green 2003, Luque et al. 2005, Martí and Luque 2004). Nanotechnology is essential in realizing most of these concepts ( Soga 2006, Tsakalakos 2008 ), and semiconductor nanocrystals have been recognized as "building blocks" of nanotechnology for use in next ...

We review recent progress towards increasing solar cell efficiencies beyond the Shockley-Queisser efficiency limit. Four main approaches are highlighted: multi-junction cells, intermediate-band cells, hot carrier cells and spectrum conversion. Multi-junction cells use multiple solar cells that selectively absorb different regions of the solar spectrum. ...

Third generation PV technologies may overcome the fundamental limitations of photon to electron conversion in single-junction devices and, thus, improve both their efficiency and cost. This ...

Photovoltaics have started replacing fossil fuels as major energy generation roadmaps, targeting higher efficiencies and/or lower costs are aggressively pursued to bring PV to cost parity with grid electricity. Third generation PV technologies may overcome the fundamental limitations of photon to electron conversion in single-junction devices and, ...

It is argued, therefore, that photovoltaics is likely to evolve, in its most mature form, to a "third generation" of high-efficiency thin-film technology. By high efficiency, what is meant is energy conversion values double or triple the 15-20% range presently targeted, closer to the thermodynamic limit of 93%.

The key property which makes organic photovoltaics so attractive is the potential of roll-to-roll processing on low cost substrates with standard coating and printing processes. Printing or coating techniques like screen, inkjet, offset, gravure, slot die, spray and others are being established and demonstrated for organic photovoltaic (OPV ...

Martin Green, one of the world's foremost photovoltaic researchers, argues in this book that "second generation" photovoltaics will eventually reach its own material cost constraints, ...

3 Organic PV Cell Structure The highlight of third-generation solar cells in general, and specifically OSC in this case, is the deviation from the conventional P-N junction that is utilized in first generation crystalline silicon and second generation thin-film technologies. With conventional P-N junction structures, the
