Pumped-storage hydroelectricity is a type of gravity storage, since the water is released from a higher elevation to produce energy. Flywheel energy storage To avoid energy losses, the wheels are kept in a frictionless vacuum by a magnetic field, allowing the spinning to be managed in a way that creates electricity when required.

Energy storage involves converting energy from forms that are difficult to store to more conveniently or economically storable forms. Some technologies provide short-term energy storage, while others can endure for much longer. Bulk energy storage is currently dominated by hydroelectric dams, both conventional as well as pumped.

Compressed air energy storage (CAES) is a type of energy storage that uses compressed air to store energy. This system involves compressing air and storing it in an underground cavern or large tank during periods of low electricity demand, and then releasing the compressed air to generate electricity during periods of high demand.

However, energy storage for a 100% renewable grid brings in many new challenges that cannot be met by existing battery technologies alone. First, more than 10 terawatt-hours (TWh) of storage capacity is needed, and multiplying today's battery deployments by a factor of 100 would cause great stress to supply chains of rare materials like ...
